

Public Fuelling Station

Hectronic designs products for all types of filling stations, public filling stations included. We have a diverse range of products for public filling stations, all of which can be flexibly and effectively implemented. The range includes HecStar, Optilevel and PetroPoint Retail. It offers a variety of features in addition to 24-hour operation. Other key components of our range of public filling station products include the OPTILEVEL level gauging system and FuelData software, which together act as the control centre for an entire network of filling systems. PetroPoint Retail in turn offers low cost Automatic Vehicle Recognition. And, thanks to our HecNet provider service, we now also manage the entire payment transaction process.

What is different about a public fuelling station, or in other words, what special features must a public fuelling station have for it to function to everyone's satisfaction. It's operation must be swift, smooth and co-ordinated. Easier said than done, but we at Hectronic can help.

A filling station can be divided into two parts; the forecourt and the shop. For the forecourt, our HecStar autofuel terminal as well as the Optilevel level gauging system and PetroPoint Retail, the automatic vehicle recognition system, provide the ideal tools. The autofuel terminals are perfect round-the-clock filling station attendants, accepting a wide variety of different payment cards, including fleet cards, EC cards, Maestro, credit cards and filling station pre-pay cards. OPTILEVEL, on the other hand, provides you with very detailed information about the contents of the pump. PetroPoint Retail helps increase vehicle turnover because its automatic vehicle recognition means the only thing the driver needs to do is fill up the tank.

In the shop, smooth correspondence with the controller and a direct link to product master data are crucial, as is fast throughput. Queues are bad for business.

Our FuelData software guarantees data transfer over large networks. All the different fuelling stations can be brought on line by a central controller, which guarantees one unified line. FuelData manages all finances and can also be described as the link between internal accounts and the banks.

The final component of the Hectronic product range is the HecNet provider service, an unrestricted payment system which is also able to analyse and present a wide variety of different figures and data. This really does complete the range of Hectronic products and services.

A major benefit; enjoy it!
